HARDGOODS REVIEW	80

This year marks the 19th year of Technine. 19 years of putting bindings on snowboarders' feet. For those of you that have grown up with the brand we thank you for your support and for new comers to T9 we are very excited to show you what we are all about. What started as a small binding company out of Colorado is now a full head-to-toe snowboard company. We have not forgotten our roots and our philosophy is the same as it was in 1994 when we made the first baseless bindings in a snowmaking workshop in Beaver Creek, Colorado. We are snowboarders making product for snowboarders. As snowboarding has progressed we have had a front row seat and have made sure that our products have progressed with the sport. Over the years, we have launched many innovations like the Baltimore toe strap and the use of scrub hooks to give you more control while riding. Our main goal is to make sure riders everywhere can count on their gear and have the best day snowboarding possible. Technine has its own unique style that you won't find anywhere else in the sport and this is why we have built a worldwide following of riders that support our cause. Each year we work very closely with not only our team of top snowboard athletes but also everyday snowboarders from all over the world, to ensure our products only get better with each passing year. With a new outerwear line designed by Cole Taylor and a fresh new board line with art from Technine artists Dave Doman, Trent Bush, and Uncle Grumpy, as well as an all-new binding, we are proud of what the new year brings. With a range of snowboard cambers to accommodate all riding types as well as many unique binding features that you will only find on Technine products, we have something for the seasoned pro to the rider ready to try snowboarding for the first time. Welcome to Technine-year 19-and I hope you all get just as excited as we are about the new line. Next year is a big mark for us as we enter year 20 but until then, have fun out on the slopes and if you bump into any of our representatives or team riders make sure you say what's up.

-Ethan Stone Fortier

MENS

Bindings

Bindings are the backbone of Technine. With 19 years of experience under our belt we can guarantee that you will not be let down with a pair of Technine bindings under your feet. Bindings are the single most important tool to a snowboarder and with the most moving parts on a snowboarder's equipment, you have to make sure your bindings are the best they can be. Trust in our experience and let us be what connects you to your board. You can count on us in the coldest days with a promise that we will provide one of the most problem-free comfortable rides in snowboarding. In 19 years we have definitely learned a thing or two about bindings and the best way to make them as well as crucial features that will make your snowboarding experience better. From single scrub hooks for added control to the ultimate in control (the double scrub hook) we have many highback options for all types of riders. If you have not tried this feature, please give it a chance as it might change the way you ride. This year the TN-12 is back with built-in cant plates as well as ultra comfy straps, and trust us, your feet will thank you after your first day riding them. We are also very proud to announce an all new binding called the T9 Classic, built for riders looking to save a couple of bucks but still want a great binding. We use the best materials possible to make some of the best bindings in the world. Get these bindings under your feet now!

A binding you can count on year after year.

R: Andrew Brewer

Last season we totally overhauled our Pro Series hardware and geometry, creating the new standard in high-end comfort and performance. For 2013-14, there are major improvements in every other component as well as offering different levels of stiffness and response for diverse riders and their riding styles.

Pro Series

Here are the specifics:

Scrub Hook: Lucas Magoon and Chris Bradshaw have been rocking second hand binding wings for years. Ebay ran out so we made 'em just for them, and riders everywhere get to share in the benefits. The new Scrub Hook highback takes an idea as old as highback bindings themselves, reconfigured for the new generation of riders and their needs. The Scrub Hook is made for increased leverage and street cred. Could this be the secret to Magoon's super powers? No. But we guarantee it doesn't hurt.

Comfort King II Ankle Strap: Nothing robs performance like pain does. The second you think about foot pain is the second you start to suck. But wait... the legendary Comfort King ankle strap returns in the form of the Comfort King II. A specially configured multi-density EVA array fits like a velvet glove, only smoother. Add this to the all-new Baltimore Toe strap or the Classic straight down strap and your feet will be working for you, not against you.

Tuned Response: Technine Pro Series bindings now offer varied flex combinations and padding configurations to match the diversity of riders and riding styles everywhere. We mix the perfect ratio of nylon to fiberglass in the baseplate, adjust the strap padding density, and tune the highback stiffness depending on if you're lapping the park or running top to bottom burners hitting everything in between. Whatever your riding style, you'll find a match in the Pro Series.

Pro-Frame: The Technine Pro Frame is the foundation on which our Pro series is built. This 6061 T6 aircraft grade frame brings the front mounting points forward of the mounting disk for immediate response both on toeside and heelside turns. It also allows the baseplate to be soft laterally without losing leverage and support from front to back. Plus, your forward lean block allows just enough give so your riding stays smooth!

Techbed: Techbed solid EVA footbeds provide complete support for your boot from front to back and side to side. This eliminates the hollow spot on most bindings where the disk sits that greatly contributes to foot fatigue and loss of response.

Techbed 3: The Technine Techbed 3 is a 3 degree full EVA footbed that creates a more natural angle with your legs in relationship to the board, giving you more leverage over your tip and tail. This means a noticeable increase in pop and control, even on reverse or flat camber boards.

Double Scrub Hook:

Half of the riders out there ride their Scrub-hooks towards the outside, and the other half to the inside. What if you want both? Technine's Double Scrub Hook is the answer for riders who want total control in every situation, because one Scrub is

1. HIGHBACKS

Technine highbacks are made from the toughest custom-blended nylon polymers, for just the right amount of flex and comfort. They also feature lightning quick response without the worry of breakage. The cup-shaped highback bottom and comfort-molded eva pads dampen vibration and provide grip to eliminate heel lift. Most importantly, our Pro Series Binding offers independent highback rotation, while not interfering with ankle strap adjustments.

2. FORWARD LEAN ADJUSTMENT

We build in a small degree of forward lean for great heel edge response but still feature a forward lean adjustment that is fully customizable.

3. BALTIMORE TOE STRAPS

The Baltimore toe strap is designed to pull the boot down and into the heelcup giving maximum response. They are also designed to distribute the pressure evenly across the boot to eliminate unwanted pressure points.

4. HEEL-CUPS

All Technine heel-cups are made from the highest grade 6061-T6 aircraft-quality aluminum. They allow the boot and binding to act as one. They also feature heel cup adjustment that allows edge-to-edge centering, giving the rider total adjustability to eliminate toe and heel drag. This feature means more freedom to customize, as your base plate disks are used to dial in personal stance width angles.

5. BASE PLATE DESIGN & MATERIALS

Baseplates are made of custom-formulated nylon polymers with short grain fiberglass to make T9 bindings ultra-strong yet flexible enough for both entry level and pro riders. Our extensive laboratory and on-mountain testing ensures that the final products meet the strict performance standards of the Technine Snowboard Team.

6. RATCHET BUCKLES

Technine's ratchet buckles are composed of specially formulated cast aluminum, steel, and nylon polymers. This allows riders to ratchet their straps down tightly while minimizing stress on the ladders. In addition, all of our binding models feature customized rubber logo grips, which give more adjusting power in cold and/or wet conditions.

7. ADJUSTABLE TOE RAMPS

All models feature toe and heel ramps designed to aid in weight and energy transfer, and ultimately, improve edge control. Our toe ramps work with boot tread contours and our custom-molded toe and heel ramp pads give comfort, dampen board vibration and impact, and allow excellent edge response while alleviating foot pain.

T9 Series:

Over the years we've created some real classics, including our often duplicated but never equaled SLC binding that takes the best combination of synthetic materials and aluminum and put them to good use. This binding has been a mainstay in the Technine line for many years, with little more than a facelift every season. The only problem with that binding is that it came in only one size, and though the pure function was there, the curb appeal had lost its sparkle. Hardcore Technine riders can now rejoice with the introduction of the new T9 Line. Working with Frank Phillips and The Public Works we've created a new standard in a basic binding. By replicating the best attributes of the long standing Technine binding the brand was built on, then overhauling the materials, function, and weight, our new T9 Series redefines what a snowboard binding can deliver. Built for the new economy, riders get that magic Technine feeling in multiple sizes and more colors than they can probably handle at an amazing price.

Technine Baltimore Toe (BLT) vs. Other Toe Caps

Have you ever heard someone say they don't like cap style toe straps? Obviously they haven't tried Technine Baltimore Toes Straps...

There is a closely guarded secret in the snowboard binding world: Most bindings that have a toe cap WERE NOT originally designed for them! If you hold a Technine baseplate up to most other brands, it's obvious that the others are designed for a straight down traditional toe strap, with a cap thrown on as an afterthought. This is because the origin point of the T9 toe strap is much farther forward completely changing the geometry and therefore the performance of the binding. Look at the 2 bindings above. Both are the same size and set in most forward ladder position. Notice the difference in the angle of engagement? On Technine BLT's, the strap pulls both down and back.

Benefits for riders:

1. The BLT allows the feel and response of a traditional straight down strap.
 2. The BLT locks the boot back in the heelcup eliminating heel lift.
 3. Energy is instantly transferred to the board because the longer base creates much more leverage and there is no upward movement in the ladders for instant response.
 4. The angle of the strap makes it impossible for it to slip up off of the toe.
- On other brands that weren't originally designed for a cap, the strap pulls much more straight back than down.

The drawbacks are clear:

1. The strap does not give enough downward pressure to allow the same feel and response as a traditional down strap.
2. The improper placement of the ladder origin causes upward movement in the strap before energy is transferred, allowing less leverage and delayed response.
3. The strap can easily slip up and over the toe while riding.

Wouldn't you rather ride a binding designed for a cap style strap? Strap into Technine and feel the benefits of the BLT.

WOMENS

Bindings

Bindings are the single most important tool in snowboarding. They are the only connection between your body and your board. When this bond is properly formed you will have the time of your life. If something is even the slightest bit off then your day is ruined. This is where we come in. With 19 years of experience we've learned a thing or two about bindings and the best way to build them. Comfort is always our first concern as well as making a product that you can count on day after day all season long. What always stokes us out the most about Technine bindings is how many old ones we see on the slopes. Sometimes we see shredders with bindings they have had on their feet for ten years. The truth is out there. We build bindings to last and our first concern is to make sure they feel good on your feet. When it comes to women's bindings this is the top concern. We learned long ago you couldn't take a men's binding and shrink it down to fit a woman's foot. The fact is you need to build a binding that's ergonomically correct to a women's foot and calf. The result is a binding that fits better than any other you have ever ridden. Lightweight, comfortable, and extremely durable...and of course a style that is unique to Technine.

Comfort King II Ankle Strap:

Nothing robs performance like pain does. The second you think about foot pain is the second you start to suck. But wait... the legendary Comfort King ankle strap returns in the form of the Comfort King II. A specially configured multi-density EVA array fits like a velvet glove, only smoother. Add this to the Baltimore Toe strap or the low profile toe strap and your feet will be working for you, not against you.

Tuned Response:

Technine Pro Series bindings now offer varied flex combinations and padding configurations to match the diversity of riders and riding styles everywhere. We mix the perfect ratio of nylon to fiberglass in the baseplate, adjust the strap padding density, and tune the highback stiffness depending on if you're lapping the park or running top to bottom burners hitting everything in between. Whatever your riding style, you'll find a match in the

Pro Series.

Pro-Frame:

The Technine Pro Frame is the foundation on which our Pro series is built. This 6061 T6 aircraft grade frame brings the front mounting points forward of the mounting disk for immediate response both on toeside and heelside turns. It also allows the baseplate to be soft laterally without losing leverage and support from front to back.

Techbed:

Techbed solid EVA footbeds provide complete support for your boot from front to back and side to side. This eliminates the hollow spot on most bindings where the disk sits that greatly contributes to foot fatigue and loss of response.

Pressure Directed Highbacks:

Technine's exclusive Pressure Directed Highbacks work with a woman's anatomy to give maximum riding performance and comfort. Because women tend to be shorter than men, the angle of their legs are greater at similar stance widths. By taking this into account, the special asymmetric design of the highback follows this shape for perfect boot-to-binding contact and instant response. The highback height is also slightly lower than on a men's binding to alleviate pressure on the calf because this muscle sits lower on a woman's leg.

1. HIGHBACKS

Technine highbacks are made from the toughest custom-blended nylon polymers, for just the right amount of flex and comfort. They also feature lightning quick response without the worry of breakage. The cup-shaped highback bottom and comfort-molded eva pads dampen vibration and provide grip to eliminate heel lift. Most importantly, our Pro Series Binding offers independent highback rotation, while not interfering with ankle strap adjustments.

2. FORWARD LEAN ADJUSTMENT

We build in a small degree of forward lean for great heel edge response but still feature a forward lean adjustment that is fully customizable.

3. BALTIMORE TOE STRAPS

The Baltimore toe strap is designed to pull the boot down and into the heelcup giving maximum response. They are also designed to distribute the pressure evenly across the boot to eliminate unwanted pressure points.

4. HEEL-CUPS

All Technine heel-cups are made from the highest grade 6061-T6 aircraft-quality aluminum. They allow the boot and binding to act as one. They also feature heel cup adjustment that allows edge-to-edge centering, giving the rider total adjustability to eliminate toe and heel drag. This feature means more freedom to customize, as your base plate disks are used to dial in personal stance width angles.

5. BASE PLATE DESIGN & MATERIALS

Baseplates are made of custom-formulated nylon polymers with short grain fiberglass to make T9 bindings ultra-strong yet flexible enough for both entry level and pro riders. Our extensive laboratory and on-mountain testing ensures that the final products meet the strict performance standards of the Technine Snowboard Team.

6. RATCHET BUCKLES

Technine's ratchet buckles are composed of specially formulated cast aluminum, steel, and nylon polymers. This allows riders to ratchet their straps down tightly while minimizing stress on the ladders. In addition, all of our binding models feature customized rubber logo grips, which give more adjusting power in cold and/or wet conditions.

7. ADJUSTABLE TOE RAMPS

All models feature toe and heel ramps designed to aid in weight and energy transfer, and ultimately, improve edge control. Our toe ramps work with boot tread contours and our custom-molded toe and heel ramp pads give comfort, dampen board vibration and impact, and allow excellent edge response while alleviating foot pain.

CLASSIC Camber

Don't let anyone tell you that camber is dead. This is the most tried-and-true of all the cambers. There is a reason why this was the only camber option available for decades. Some riders believe that all the other cambers are just a fad and at the end of the day when the smoke clears, everyone will be back riding traditional camber again. Camber riders argue that traditional camber is the most versatile and it performs well in all conditions and all types of riding, from powder to the park. Beginners will actually learn how to use their edges when on the mountain for the first time, which will help them build long-term riding skills that will in turn make them that much of a better rider. Everyone knows that old school riders prefer this type of camber. We suggest you take one of these for a spin and find out why the riders with the most knowledge of snowboarding ride cambered boards.

Featured Kit:
Icon Board with Elements Bindings

BRADSHAW PRO

GONE FISHIN BOARD

STYLE # F13B0BRA

Bradshaw is a simple man with simple pleasures. He likes the controlled, calculated feel of traditional camber and he loves fishing. This snowboard's base pays homage to legendary snowboarder Jeff Brushie's old fish art, and for those of you who have been around long enough to remember this we're pretty sure you prefer cambered snowboards. The custom V formation Carbon taping creates extreme pop in the nose and tail. The jib core profile makes this board not only the lightest board in the line but the softest flex...just the way B Shaw likes it.

LM PRO GREMLINS BOARD

STYLE # F13BOLMG

The L.M. Pro is just not any traditional camber board. This board is built for fun and it's built to last. Lucas is real hard on his equipment so we use only the best materials when constructing this jib machine. We went all out by adding Carbon stringers for extra pop, an ultra thin jib core profile keep the weight down, and added edge dampeners to cut back on vibration and add some extra cushion for the pushin'. The art depicts Lucas and his homies Gremlins playing a dice game, and if you've ever spent any time with Lucas you know this art matches right up to his personality. 4, 5, 6, craps!

OVERVIEW

SHRED TILL DEATH BOARD

STYLE # F13BOSTD

A soft board for jib tricks that won't wash out when you point it. The S.T.D. is a perfect choice for riders of all skills.

It's fun and easy to ride in all conditions and from day one to one thousand, this board will not let you down. Great for the park or anywhere else on the hill, this all-mountain freestyle board features only the most proven ingredients. Full ultra light poplar wood core, extruded base, and bi-axial fiberglass all come together to form the perfect board. It's no secret that this is one of the most ridden boards by the Technine team for all types of riding.

OVERVIEW

FLAT

Camber

The camber that offers the best of both worlds! Many riders say that flat camber offers a loose and catch-free ride, similar to reverse camber while remaining relatively more stable and predictable like a camber board. While it doesn't have the forgiveness of a reverse cambered stick, it does have all the aggressiveness of camber. Some can argue this is the best of both worlds and is just right in all conditions. Flat boards are right there when you need them and never too much to handle. A flat camber definitely won't give you the amazing floating in powder sensation that reverse camber can offer but it will definitely hold its own when it comes to pipe, jumps, and hauling ass down groomers. This quiver killer might be the only shape you need.

Featured Kit:
Asym Elements Board
with Elements Bindings

ELEMENTS ASYM BOARD

STYLE # F13B0EAS

The Asym's shape is guaranteed to blow your mind...or at least blow up the spot. Asym boards offer more control than you have ever felt in a snowboard with an easier transition from your heel to toe edge. Carbon crosses in the nose and tail add rigidity to the flex, offering a smooth all-mountain ride, so you can cruise easily and in style.

LM PRO FLAT HUSTLERS COMBO BOARD

STYLE # F13B0LMH

The Lm Pro Flat is the ultimate jib machine. When it comes to designing a board for Lucas Magoon it has to be lightweight with a super soft flex and at the same time be indestructible. We have achieved all of Magoon's prerequisites by implementing the custom jib profile and then adding Carbon stringers, rubber edge dampeners all sandwiched together with bi-axial glass and a rock solid sintered base. The hustler's combo flat camber is a tool and its only job is to rip up any and all of the snowboard parks the world over!

HYBRID Camber

As board designers dove into the possibility of mixing camber types, many new categories of camber were born. We have placed these new school camber types in a catch-all category called Hybrid Cambers. Welcome to the future of camber as well as a place where you will find cambers as unique as your own personal riding style. With two styles. With two types of flat rock camber, #9 combo hybrid camber as well as Camrock camber, Technine has something for everyone. Be sure to spend some time on our tech pages learning about all of these new style cambers, but if you really want to find out which if any are good for you then do yourself a favor and find a demo in your local area and ride these bad boys.

Featured Kit:
Thompson Pro Board with
Team Thompson Bindings

ELEMENTS HYBRID BOARD

STYLE # F13BOELH

The Elements Hybrid is the ultimate ride that offers the best of both cambers. It's guaranteed to deliver good times from first chair to last run! Spin and butter like you can on a rocker shape but enjoy all the pop of a traditional cambered board. While the art is a nod to a legend of the skate world, the hybrid #9 combo camber is sure to be legendary in its own right.

OVERVIEW 1 2 3 4 5 6 7 8 9 FLAT ROCK 4400

REVERSE Camber

Rocker camber is essentially the opposite of camber. As this product hit the market it blew up fast. Let's face it: reverse camber is a great tool for beginner riders and really can make snowboarding easier. The worst part of your first couple days on the hill is all the bumps and bruises you get from catching those edges. Having your nose and tail bend upward cuts down on this dramatically. Now add in that you can kill it in the powder and press in the park better then ever before and you really have a highly sought-after snowboard feature. Technine's 9 Rocks reverse camber is one of our most popular cambers for all of these reasons and more, so switch it up this year and put it in reverse. Reverse camber, that is.

Featured Kit:
Brewer Pro Board with Team Brewer Bindings

BREWER PRO BOARD

STYLE # F13B0BRP

Andrew Brewer's first pro model! It was time for Brewer to move from the Team Series into a pro board and this model is hands down one of the most fun boards to ride in our line. Lightweight, super soft, and designed with our 9 Rocks reverse camber technology, this single radius reverse camber has a 10cm middle point that touches the ground while the rest is above it. Although this board is designed for messing around in the park and perfecting perfect presses and butters, some riders swear by its unmatched performance in the powder. The nose just floats up out of the pow, allowing you have the feel of a long powder machine on a smaller board. Get ready to perfect powder buttering this year as well as having a blast in the park. Every rider should have a Brewer Pro in their quiver.

WOMENS

Boards

At Technine we take the same approach to designing the women's line as we do with the men's. The focus is placed primarily on having fun. While our board developers are staying on top of what the best women's shapes and camber profiles need to be in the line, our artists are coming up with all sorts of new ideas that will look fresh in the snow. This all comes together on a super soft, light board that was built for one reason and one reason only. Having fun in the snow with your best friends. Pushing your skills as you progress in the park. While you work on stepping up your game you can count on us to provide you with a solid ride under your feet. If its butterflies and rainbows you are looking for we think you've come to the wrong place. If it's dope art that looks as good on your wall as it does on a top-quality board, then welcome to Technine!

GLAM ROCKER BOARD

STYLE # F13BWGLA

The effortless ride of the Glam Rocker is like nothing you've ever experienced. The single radius rocker lifts the tip and tail contact points creating a board that is easy to press and fun to ride. The soft flex combined with the 9 Rocks reverse camber will step your jibbing up to the next level and give you some of the most fun shred sessions of your life. The Glam Rocker will also rock in the pow, as the reverse camber helps keep that nose from sinking allowing you effortless pow turns all day long.

General Construction

Teaming up with two of the most respected snowboard factories in the world ensures that as the sport progresses, our technology and engineering capabilities do as well. Our development team works countless hours to make sure every board pressed lives up to our reputation for quality, shelf appeal and most of all, the ability to give you some of the best days riding in your life. We build our boards with a huge emphasis on the final pricetag without sacrificing any craftsmanship or quality. Continued performance day after day and ollie after ollie as well as turn after turn. Technine snowboards offer countless days of exceptional rideability and good times. For the '13/'14 collection we have re-tuned our technical design whiled adding innovative shapes, all new cores and camber profiles, and of course, paying special attention to quality as well as setting a new standard for freestyle, park and urban snowboard design.

Board Tech

Tip-to-tail, edge-to-edge Wood Core Construction: The essence of each board is its core. It all starts with high quality wood!

Power Tech Core

Full tip-to-tail poplar wood core with Finger Joints. Poplar provides strength and the perfect amount of feel and control. Poplar is also known for its perfect balance of stability and energy.

Power Tech Ultra Lite Core

Full tip-to-tail ultra light poplar wood core with finger joints. Reduced weight for a solid ride with lots of pop and control.

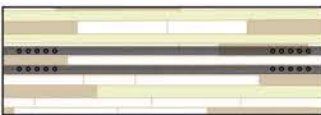

Dual Tech Core

Full tip-to-tail poplar wood core and Finger Joints with added birch stringers. These two strips of birch running tip-to-tail through the inserts gives the board added pop plus extra-reinforced insert strength. Birch and poplar together are the perfect combo for lightweight, responsive, easy-to-ride flex.

Honeycomb Air Core Insert

More bounce to the ounce! Milling out a strip of the core in the center of the board and added a honeycomb air core insert makes this board incredibly light-weight. Careful when jumping, or you might just overshoot the landing

Quad Core

Hands down the lightest and advanced core we have. Three species of wood are placed together (Birch, Paulowina, and Poplar). Creating a super lightweight core giving you cat like responsiveness and loads of pop. Pair with bamboo stringers and you will be unstoppable!

Fiberglass / Layup

Bi-Axial Laminate

Biax is perfect for freestyle riding. Lightweight and efficient. The fiberglass lay up is built for the type of riding you love and offers a smooth, even, dependable flex without adding unnecessary weight.

3 Layer Interior Rubber Dampening (All men's boards)

Add three layers of rubber and you now have the ultimate in strength, performance and dampening. No more board chatter in high-speed situations and the ultimate feeling of cush under your feet.

Rubber Edge Dampener's

By placing a specially-designed rubber dampener between the sidewall and edge located from front to back inserts not only dampens vibrations and reduces fatigue but also creates the perfect jib weapon. Reduced vibrations while sliding rails as well as impact resistance means this board is built for the type of riding that Lucas does best.

Internal Rubber Damping

By placing a rubber layering system underneath the upper fiberglass and in-between the lower fiberglass and base, the boards have less chatter and perform better at high speeds. This process promotes a smooth ride, giving the rider more board control and increased impact resistance.

Ultra Thin Jib Core Profile

To get the softest jib machine in the world we had to redesign the core! Bradshaw and Gooner like soft, poppy boards build for terrorizing the parks of any resort. Soft flex patterns equal a fun easy to ride board. We have designed a special ultra thin jib core that has a unique core profile that allows the board to be thinned out in just the right areas to give you a one-of-a-kind smooth soft flex pattern yet retain all the strength needed to make a board that's built to last.

Custom Jib Edge Factory Detune

Detuned to perfection right out of the wrapper. This custom park feature gives the rider nothing to worry about when hopping on a box or rail. The edges still allow for the perfect turn but are detuned in all the right places to give the rider a worry-free attitude when throwing down new moves on any jib.

Core Additives

If you want to ollie higher than before and get more power from your pop, additives are the name of the game!

1. Carbon Taping

Complete control in a variety of conditions and terrain! From contact point to contact point, the carbon taping promotes even flex and decreases flex fatigue.

2. Full Carbon Taping

Tip-to-tail Carbon and Kevlar taping offers a smooth, even flex and long term stability from the tip to the tail of the board. Enhanced ollies and stomping control for mutple seasons of riding.

3. V-Tech Carbon Taping

Running carbon in a V formation in the tip and tail of the board is all about getting that extra snap in your ollies. A smooth, even flex on the nose and tail will allow for stronger pop and smooth takeoffs when hitting jumps, as well as more stability when landing and riding out.

4. Carbon Cross:

If you want to ollie higher and get the most out of your pop the Carbon Cross stringers will deliver. The X formation in the nose and tail channels the flex of the board and distributes your pop evenly for a clean pop every time.

5. Double Carbon Cross:

Double the carbon equals double the pop. More bounce to the ounce on a carbon lay up built for the rider who demands performance.

6. Carbon V with Tip to Tail:

This is the ultimate carbon lay up! Not only can you harness a better Ollie with the V carbon formation but the tip to tail springs add a more even flex to your entire board allowing for more control and a smother ride. Avoid chatter and maximize Pop!

Bases

Extruded Base:

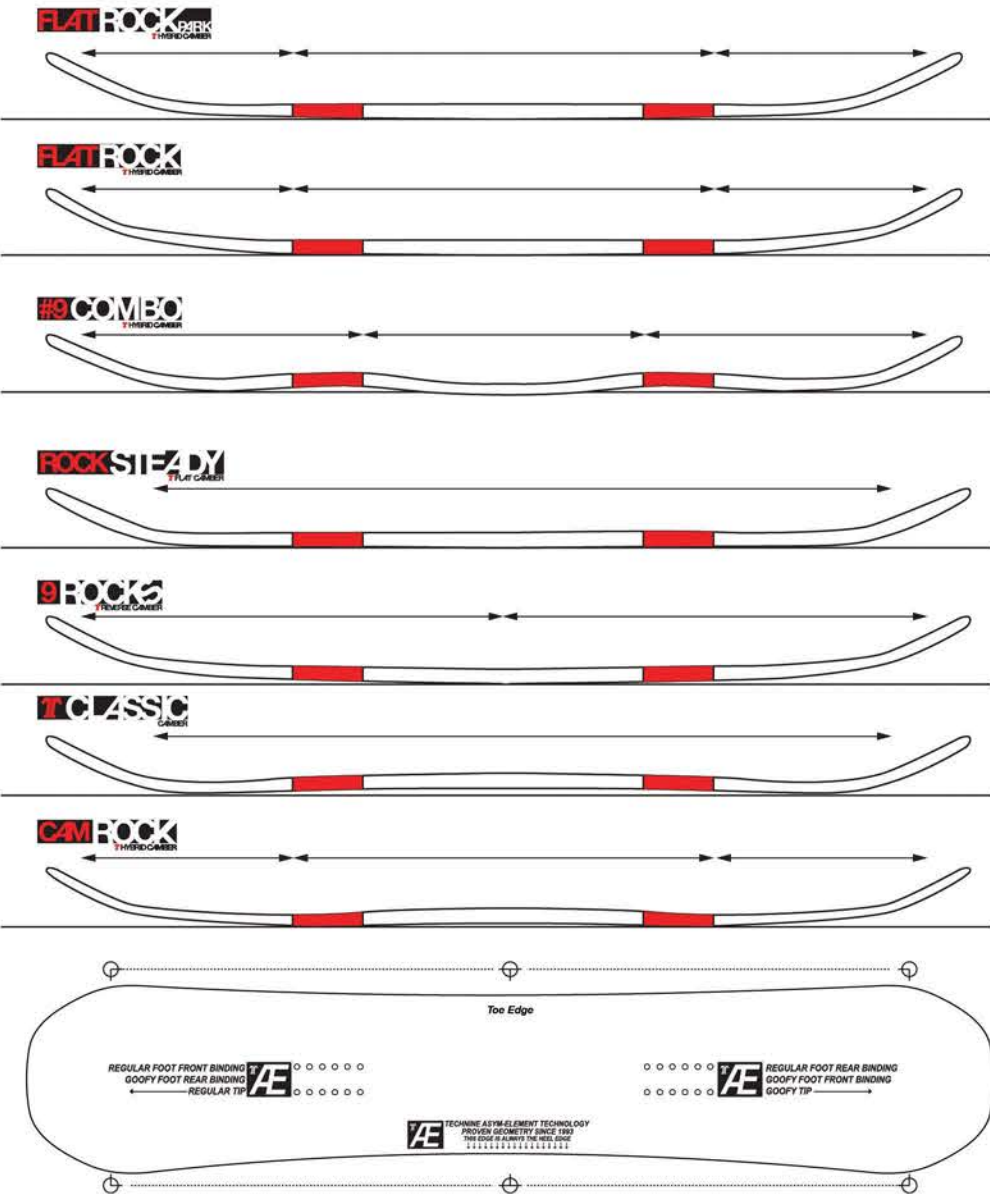

Extruded bases are really good for freestyle boards, park boards, and especially for street boards because they can be repaired easily. As Technine is a freestyle company we feel this is the perfect base for our riders.

Sintered Base:

The P-Tex base material is ground into powder, heated, pressed, and sliced into shape. Sintered bases are built with the hardcore in mind. Extremely durable and designed to hold wax longer. These bases are extra fast and built tough.

Extras

Technine always goes the extra mile when making a snowboard. Shelf appeal is the name of the game. Let's face it...with all the cash you're dropping on a shred sled, the board better ride amazing and look good when its sitting against the wall at your crib. From specially designed metal inlays to pushing the limits of art and design capabilities, Technine is all about making snowboards look good. For 2011/'12 you will see a great mix of matte gloss ink effects, like Metallic inks and foil stance indicators as well as our custom rough touch ink. We have collaborated with an amazing group of artists who all bring a different unique style to what we do and how we do it. From the more logo-driven heavy Technine style to a more art driven feel, the line has perfect balance.

Asym Sidecut:

The basic theory is that through body position, joint flex direction, and angulation, a snowboarder has much more control over a snowboard in a toeside turn versus a heelside turn when riding forward. This is also true when riding fakie, but intensified because riding backwards doesn't feel as natural, and initiating and completing turns is much less natural. How many times do you wash out riding forwards on heelside turns, and how rarely do you wash out on your toeside edge? Have you ever noticed how fluid and powerful turning can be riding going forward, and how awkward and difficult the same is riding fakie? How much easier it is to approach a rail or jump forward than fakie? All that has much more to do with body position and the way body joints bend and muscles work than any other factor. The AsymElements sidecut geometry compensates for these differences in riding physics by creating a separate sidecut radius for the toeside and heelside edges, with the goal of equalizing the turning capability of both toeside and heelside turns, greatly increasing board control. The AsymElements geometry has been in constant refinement since its new-school inception in the early 90's (namely in Tarquin Robbins' pro models) when riding duck stance and fakie became mainstays in snowboarding, and by adding Technine's Rock Steady Flat Camber technology the AsymElements is the next step in a lineage of the best riding freestyle snowboards ever made. Because of the unique geometry, the true twin board only has one heel edge and one toe edge, and so you always mount centered with your heel on the heel edge, regardless of goofy or regular, meaning if you're goofy, then the regular nose is your tail, and vice versa.

Flat Rock Park:

The ultimate hybrid camber for park and freestyle riding. From insert to insert you have all the benefits of Flat Camber. The flat design between your feet offers pop, precision and control. The nose and tail taper up into our single radius reverse camber offering supreme rideability, deep presses, and a super catch-free edge.

Flat Rock:

With a primarily flat design, you have a spring-loaded ride that will not only blow your mind but also offer all-terrain high performance. The nose and tail begin to blend into reverse camber just along the outside edge of your binding for the most forgiving fun float and all-around easiness.

#9 Combo Hybrid Camber:

This is a hybrid camber. Traditional camber under the bindings leading out to the nose and tail while between the bindings has a rocker camber. The traditional camber in the front and back allow you to preload the board for extra pop into ollies, while the rocker between the bindings moves the control to the center of the board. Spinning and buttering just like you could on a rocker, but with the pop of a traditional camber board.

Rock Steady Flat Camber:

If you want the best of both worlds then this is the camber option for you. Our whole team has embraced flat camber because of the benefits of heavy pressability combined with all the pop of a traditional cambered board. Some say reverse camber should be left to powder riding and kids just learning how to press. Flat camber is for riders ready to take their freestyle and jibbing skills to the next level. Testing has also shown that flat camber is much more stable and really helps riders lock in landings and power through turns.

9 Rocks Reverse Camber:

A rocker built to have fun in the park! From pressing boxes to sliding cold metal street rails, we have built the ultimate reverse camber for jibbing. For our rocker boards we have a single radius angle reverse camber. Only 10cm of the middle point of the board is touching the ground, and the rest of the camber is above it. The ultimate result is a poppy board with a very stable nose and tail built for presses and having fun in the park.

Classic Camber:

Traditional camber has been around since snowboarding began because it works. It keeps the contact points of the board on the snow, providing stability at high speeds and stores potential energy allowing the board to pop into ollies and pump out of hard turns.

Camrock Camber:

The power of a traditional camber without catching an edge while buttering, welcome to Camrock! Between the bindings is traditional camber while the tip and tail contain rocker cambers. Essentially, this is the opposite of combined camber. The raised tip and tail help float the board in powder and reduce the chances of edge catch, but with the benefit of the traditional camber pop beneficial with ollies and while powering out of turns.

MENS

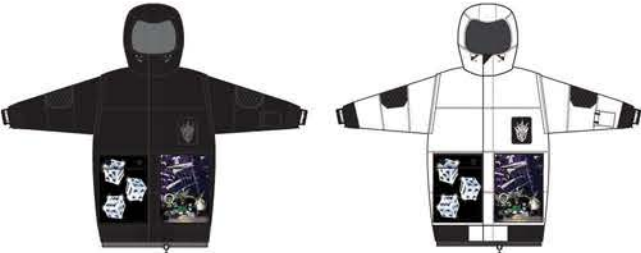

Outerwear

After 19 years, Technine has amassed some of the most loyal supporters we could've ever asked for, and because of them, we are still here today. When you wear a Technine garment, there's a certain sense of pride that connects you to the brand the lifestyle, and most importantly, the family. We've listened to our fans needs and delivered exactly what they asked for this season, and this year's collection is dedicated to them.

GOONER SIG. JACKET

SIZES:	FIT:	STYLE #
S, M, L, XL, XXL	STANDARD w/ Removable Sleeves	F130JG00

- 10,000mm/10,000gm/m/24hrs Coated Fabrics with DWR
 - Unbeatable Features and Detailing
